Inclusive design of school latrines – how much does it cost and who benefits?

Headline issues

- WEDC research shows that the additional cost of making a school latrine accessible is less than 3% of the overall costs of the latrine.
- The most cost-effective way to improve access for children with disabilities is to incorporate accessibility into the design from the outset (inclusive design) rather than making expensive changes later.
- Inclusive design means a user-friendly, child-friendly design, which benefits all users, including adolescent girls, small children, and children who are sick.
- However well designed the latrine, other factors such as location, distance and approach path affect accessibility and need to be part of planning and design.

Introduction

Children with disabilities – physical, sensory (blindness, deafness), intellectual, or mental health impairments – are recognised as one of the groups least likely to be enrolled in school. 5% or less complete primary school1, leaving them more at risk of poverty2. Disabled girls are particularly affected.

Children with disabilities have a right to education guaranteed under the UN Convention on the Rights of Persons with Disabilities3. Many of these children could participate in education if the school environment was accessible4. School planning and construction rarely consider issues of accessibility and barrier-free design, either because of lack of awareness, or because of a perception that it must be expensive5.

Poor school sanitation hinders many children from going to school, and exposes them to increased health risks6. Although many governments and agencies have policies about the inclusion of children with disabilities in school, these rarely consider water, sanitation and hygiene (WASH) issues.

How much does accessibility cost?

Making public infrastructure accessible can cost less than 1% of total construction costs, if accessibility is planned from the outset7. However, this evidence is not specifically related to water and sanitation. Limited data from WaterAid estimates that it costs 8% extra to make a school latrine accessible8.

Research carried out by WEDC in collaboration with World Vision and WaterAid in Ethiopia found the additional cost of making a school latrine accessible to be under 3% of total costs (see Table 1).

What makes these latrines accessible?

Each latrine block to have one accessible cubicle with:

- additional space (at least an extra 1m²) (e.g. Figure 2)
- wider door (minimum 80cm wide)
- handrails for support attached either to the floor or side walls (e.g. Figures 5, 6 and 7)
- raised toilet seat, preferably fixed (e.g. Figures 5, 6 and 7)
- an access ramp ideally with a gradient of 1:20, but if space is limited, maximum gradient 1:12. (Figure 4)
Who benefits?
During primary school visits, users were asked for their views on the inclusive latrines compared with the conventional latrines. The key benefits they identified were:

- Users on crutches or in wheelchairs could use the latrine more easily and no longer had to go home to use the latrine.
- Blind users found the access ramp enabled them to walk with ease and confidence, and could use their white stick to easily locate the toilet seat.
- Young children could hold the support rails to better aim at the toilet hole.
- School directors concluded that the latrines benefitted all schoolchildren from grade 1 to 8, including disabled children, as they were safer and more secure than the old latrines. They also reduced soiling of the latrine and, since they were popular with the children, reduced open defecation. Some parents have promised to enrol their disabled children in school.

Design and construction recommendations
- New designs and plans must be developed in consultation with the intended users or their representatives.
- External factors such as distance, location, and surrounding access are equally important (Figure 3).
- Monitoring of construction is crucial. Designs that look good on paper are often ‘re-interpreted’ by contractors who don’t understand the reasons for the changes.
- Awareness-raising about appropriate use/misuse of inclusive design features should be incorporated into school hygiene education, and O&M plans.

Number of cubicles per school
Girls:
- 1 cubicle for every 25 girls, (minimum 4 cubicles) including 1 cubicle for disabled girls

Boys:
- 1 cubicle for every 50 boys (minimum 4 cubicles) including 1 cubicle for disabled boys
- at least 1 metre of urinal for every 50 boys

Figure 2. Floor construction: cement block or burnt brick with concrete slab (boys)
**Briefing Note 1**

**Inclusive design of school latrines**

**Water**

Latrines can contaminate nearby groundwater, so locate them at least 15 metres from wells and boreholes on the downhill side. Keep latrines 15 metres from any surface water such as ponds, rivers and streams. Surface water can seriously damage latrine structures. Make sure that rainwater can drain away quickly and that surface water running across the site after heavy rain is diverted away from the latrine block.

Access
Latrine blocks must be connected to other school buildings by clearly defined paths (Figure 3). Paths must be wide enough for two people to pass each other, have an even surface and be self-draining. Steps may be necessary in steeply sloping areas but provide an alternative route using ramps for people with walking difficulties.

Cultural traditions
The religious or cultural traditions of some communities may also have a bearing on the siting and alignment of latrines. It is always important to consider such traditions before finally deciding where to locate the latrine block.

What about existing latrines?
• An absolute minimum requirement is to provide two widened toilet cubicles with a widened door, one for females and one for males, in each school (e.g. Figure 2).
• Ramps, handrails and seats are easier to fit later, and can be added as required.
• Water for hand-washing and personal hygiene is important, even where the type of latrine technology does not require water for flushing.
• Lack of inclusive WASH in schools is only one of the barriers children with disabilities face. Others include obstacles in the overall school environment, the attitudes of teachers, parents and students, and education policy, curriculum and teachers’ skills. This range of barriers needs to be addressed holistically.

Acknowledgments
The research in Ethiopia was made possible by
• World Vision Ethiopia, who provided information and logistical support
• DFID who provided funding for research expenses
• Sue Cavill who provided valuable comments on the text.
